Solution

Track your inventory in minute!

Technology & Applications

Linen management system manages the entire linen inventory and the lifecycle of each individual linen item from purchasing through the daily use to its final. The technology of RFID tags works by electronically reading the RFID tags that are sewn to the linens. This allows them be automatically tracked, counted and be recorded for management purposes. Besides, the linen management tracking system has the extensive generating reports with real-time information, which can be accessed by the management and authorised authorities.

Advantages

- Ability to track the movement of individual piece of linen.
- Enabling the healthcare industry/hospitality industry/apparel industry to manage the linen inventory.
- Reduce labor works and times
- Limits the build-up of excess inventory at any point in production.
